

Release Notes

Client software v4.7.5

Bugfixes

- Minor changes for BM9930-based updater images

Client software v4.7.4

Bugfixes

- Default password policy updated for certain device types
- Password hint will always be displayed when requested by user

Client software v4.7.3

Improvements

- Allow device to connect to SafeConsole without deployed certificate

Client software 4.7.2

Bugfixes

- A backup will not be locked when the device is factory reset so that the same device can continue to back up to the same storage
- Support for CA issued SSL certificates that were previously not supported
- Improved stability

Client software 4.7.0

Important

- Backup of devices running 4.7 or later requires the ShieldShare service to be installed alongside SafeConsole
- EasyShare, WebLogin and Certificate Carrier have been removed

New Features

- Secure file sharing using ShieldShare
- Restrict use of devices to within a secure perimeter using ZoneRestrictor
- Backup devices over the Internet using ShieldShare
- Backup is now also available for OS X clients
- Administrators can request user information, such as phone number, and search for it in SafeConsole
- Published applications and documents can be set to automatically launch when device is unlocked

Improvements

- Windows and OS X clients are now identical visually and feature wise
- Improved usability of 'set password' screen
- Use of the Actions menu has been minimized and have been replaced with more visible controls
- Settings page has been introduced for password management and feature configurations
- Technical information about the drive is available from the about window
- Log files can be created from the about window to help troubleshooting
- Forgot password screen will appear automatically after a number of failed attempts
- The application window will always be visible
- SafeConsole SSL certificates can be renewed without proactively configuring the new certificate to all devices
