

Version 4.9.4

New Features

- Devices with software later than 4.2 are now automatically changed to in use from lost when they are unlocked.

Version 4.9.3

New features

- Allow disabling email confirmation when users register devices.
- Added GUI for configuring internal SMTP settings to installer.

Improvements

- Streamlined internal SMTP settings to allow full customisation.

Version 4.9.2

Fixes

- Corrected links on deployment page and in manual.
- Corrected Automatic Connect Tool zip file to work in built-in zip file viewer on Windows.

New Features

- It is now possible to continuously export audit logs to external locations.

Version 4.9.1

Fixes

- Corrected handling of Active Directory authentication.
- Corrected handling of Active Directory synchronisation.

Version 4.9

New Features

- Make it possible to prevent users from joining external ShieldShare shares.
- Change installation system to improve upgrades.

Improvements

- Upgraded database implementation for improved performance.
- Included CardWave SafeToGo provisioning tool.
- Sending files using Publisher to users without access to the actual file server has been improved.

Fixes

- Only attempt to restore the backups a user has access to when several users have used the same device.
- Allow a user to create backups for a device that has previously been assigned to somebody else.
- Corrected error codes in the administrator GUI.
- The deployment tools can safely be downloaded using Internet Explorer.

Version 4.8

New Features

- Verify the ShieldShare URL when it is changed on the Server and ShieldShare configuration page.
- Warn users when the server license has expired.

Improvements

- Upgraded database drivers for improved performance.

Fixes

- Corrected access permissions for manager role.

Version 4.7.4

Fixes

- Includes a security patch for the built-in Tomcat web server.
- Updated Sophos SafeConsoleReady Antivirus package.

Version 4.7.3

Fixes

- Backup can now be created after device has changed owner if device software is 4.8 or greater.
- Restore will not attempt to restore multiple backups from a device which has had multiple owners.

Version 4.7.2

Improvements

- Allow registration of devices upgraded from 4.2 to 4.7 without reassigning them.

Version 4.7.1

Improvements

- Tomcat upgraded to 6.0.37.
- Cardwave SafeToGo preprovisioning tool bundled.
- Corrected mapping from hardware ID to product name.

Version 4.7.0

New Features

- Backup devices over the Internet using the ShieldShare engine. Backup will now also be available for Mac OSX clients.
- Information about users and devices can be collected in a searchable manner.
- Full HTML manual available during setup and from within the administrator interface.

Improvements

- Warn logged in administrators when prohibiting reset for users to avoid bricked devices when uninstalling server.
- Dangerous configurations for Server Connection are now hidden to avoid accidental misconfiguration.
- ShieldShare exclusion rules can be applied to filter out file types that should not be shared when using ShieldShare.

Version 4.6.8

Fixes

- IP filter is now read from SafeConsole.ini during configuration and will not be cleared when rerunning the installer.

Version 4.6.7

New Features

- Denied access is a new state in the Device State Management. Devices will automatically return to normal state if they are brought back to the Trusted Zone.

Improvements

- Setting an empty IP address filter in the Configurator will allow all IPv4 and IPv6 addresses.
- Installation is more robust.
- New improved deployment page.
- Users are prompted before overwriting certificate.
- Manuals and the deployment page are shown only during setup, not when rerunning the Configurator.

Fixes

- The Trusted Zone filter is now read from SafeConsole.ini during configuration.
- The SafeConsole deployment tool handles servers with "safeconsole" in the name correctly.
- Device State Management will no longer disable devices when reassigned.
- The Mac OSX deployment tool package now works.

Version 4.6.0

New Features

- ShieldShare invitations to external parties has been added.

Fixes

- Device users are updated when moved in active directory.
- The number of used ShieldShare slots is counted correctly.
- The certificate password field in the configurator is now a password field.
- The Configurator will fall back on Internet Explorer when opening manuals and the login page if the default browser fails.
- The Configurator will now find all ActiveDirectory groups.
- The truststore password will no longer be overwritten when generating a new certificate or reinstalling.
